

# Mandarin has subjectivity-based adjective ordering preferences in the presence of *de*

Yuxin Shi, Gregory Scontras University of California, Irvine

the meaning lab  
@UCI

## adjective ordering preferences

pre-nominal post-nominal

big blue **car** **car** blue big

English  
Hungarian  
Turkish  
Hindi  
Telugu  
Tagalog  
⋮  
Arabic  
Indonesian  
Basque  
Selepet  
Mokilese  
Farsi  
⋮

**robustly attested** in a host of **unrelated languages**, both with **pre-** and **post-nominal** adjectives

what about Mandarin?

## previous work on Mandarin

- Multi-adjective strings in **Mandarin optionally feature the linking particle 的 *de*** (den Dikken, 2006; Scontras & Nicolae, 2014)
- Sproat & Shi (1991) claim that **when *de* is present, there are no restrictions** on adjective ordering

大的 蓝的 车      蓝的 大的 车  
dà-de lán-de chē      lán-de dà-de chē  
big-DE blue-DE car      blue-DE big-DE car

- Without *de*, Mandarin has English-like preferences** that obey the class hierarchy below

大 蓝 车      \*蓝 大 车  
dà lán chē      lán dà chē  
big blue car      blue big car

QUALITY > SIZE > SHAPE > COLOR > PROVENANCE

## linker norming study

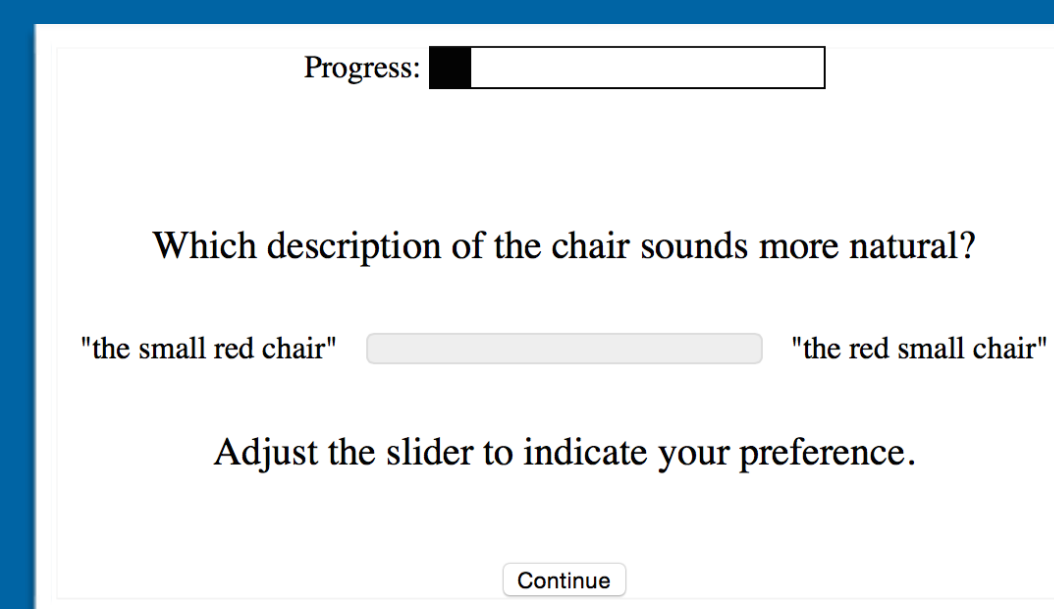

- We used a version of the ordering preferences experiment from Scontras et al. (2017) to assess the optionality of *de*
- 20 native speakers** of Mandarin participated
- de* appeared on **both** adjectives, on only the **first** adjective, on only the **second**, or on **neither** adjective
- Participants indicated whether the options sounded **natural**

👎 56% adj<sub>1</sub> adj<sub>2</sub> noun  
😊 70% adj<sub>1</sub>-DE adj<sub>2</sub> noun  
👎 55% adj<sub>1</sub> adj<sub>2</sub>-DE noun  
😊 66% adj<sub>1</sub>-DE adj<sub>2</sub>-DE noun

## previous work on English

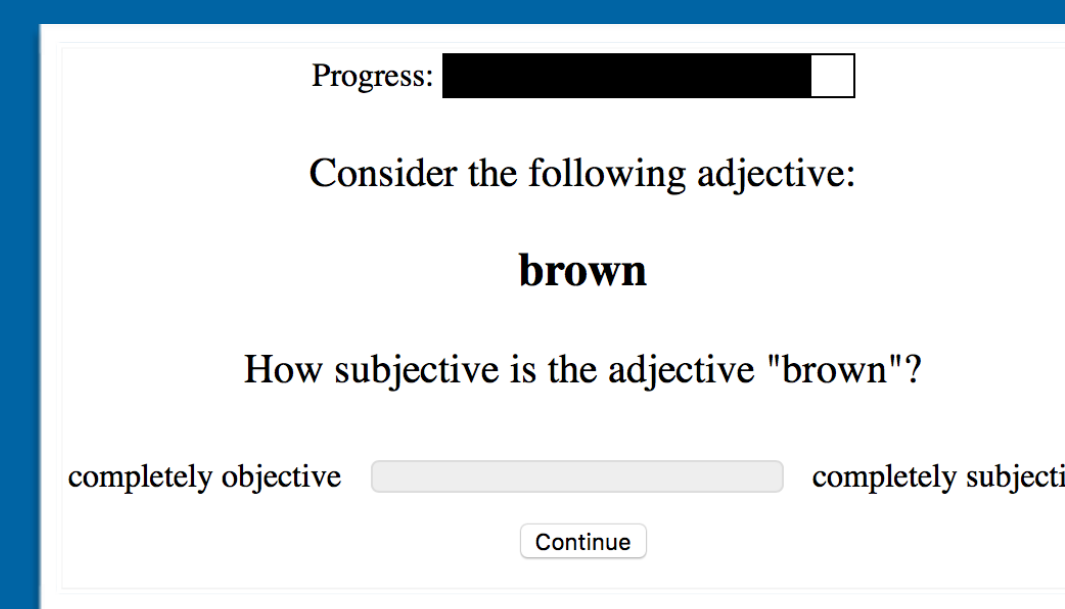

### measuring preferences

### corpus validation

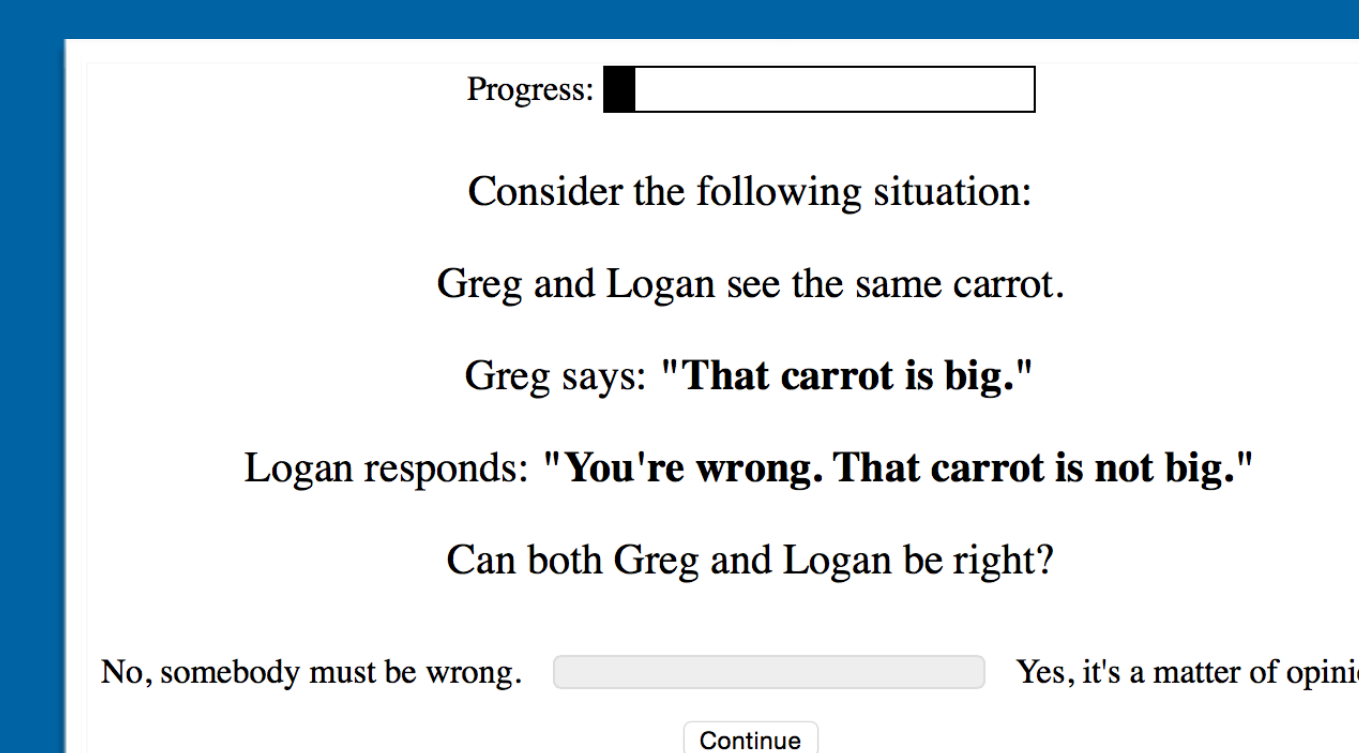

### measuring subjectivity

Scontras et al. (2017) showed adjective **subjectivity** to be a **robust predictor** of ordering preferences in English

big blue car  
subjectivity decreases

### faultless disagreement validation

## adjectives and nouns

We translated the English materials from Scontras et al. (2017)

adjective	translation	class	adjective	translation	class	noun	translation	class
新 xīn	new	age	好 hǎo	good	value	ping guǒ	apple	food
旧 jiù	old	age	圆 yuán	round	shape	xiāng jiāo	banana	food
蓝 lán	blue	color	方 fāng	square	shape	hú luó bo	carrot	food
棕 zōng	brown	color	大 dà	big	dimension	zhī shì	cheese	food
绿 lǜ	green	color	长 cháng	long	dimension	xī hóng shì	tomato	food
紫 zǐ	purple	color	窄 zhǎi	narrow*	dimension	yǐ zi	chair	furniture
红 hóng	red	color	短 duǎn	short	dimension	shā fā	sofa	furniture
黄 huáng	yellow	color	小 xiǎo	small	dimension	fēng shàn	fan	furniture
金属 jīn shǔ	metal	material	宽 kuān	wide*	dimension	zhuō zi	table*	furniture
塑料 sù liào	plastic	material	干 gān	dry*	physical	diàn shì	TV	furniture
木制 mù zhì	wooden	material	硬 yìng	hard	physical			
坏 huài	bad	value	软 ruǎn	soft	physical			
美 měi	beautiful*	value	湿 shī	wet*	physical			

\*where direct translation was not possible, we used words from the same semantic class

## adding our results to the cross-linguistic picture

**Mandarin is similar to Tagalog**, another language with linking particles in the presence of adjectives (Samonte & Scontras, 2019). In Mandarin the linker is often optional; in Tagalog the linker is obligatory. **Both languages have subjectivity-based ordering preferences.**

## measuring ordering preferences

- We replicated the ordering preferences experiment from Scontras et al. (2017) using Mandarin translations

- 32 native speakers** of Mandarin participated

- Participants indicated their preferred order by adjusting a slider with endpoints labeled with multi-adjective nominals that differed in the relative order of the adjectives; all adjectives appeared with *de*
- We averaged naturalness ratings to arrive at a single preferred-distance measure for each adjective; values ranged from 0 (preferred closest to the noun) to 1 (preferred farthest from the noun)

- Mandarin does have **stable preferences with *de***, as is evident in the significant deviation from chance (i.e., from 0.5) in several of the class distance measures

## measuring subjectivity

- We replicated the faultless disagreement experiment from Scontras et al. (2017) using Mandarin transitions
- 35 native speakers** of Mandarin participated
- Comparing subjectivity with naturalness ratings, we see that in Mandarin, **subjectivity is a reliable predictor of ordering preferences** ( $r^2 = 0.48$ , 95% CI = [0.26, 0.67])
